3-D cultured human epidermis
LabCyte EPI-MODEL

LabCyte EPI-MODEL is a 3-D human cultured epidermis produced from normal human epidermal cells (keratinocytes) that are cultured at the air-liquid interface to become stratified. LabCyte EPI-MODEL was developed as an alternative to animal experimentation performed in skin irritation tests. Because it is composed of human epidermal cells, the structure of LabCyte EPI-MODEL is morphologically similar to that of the human epidermis. Furthermore, LabCyte EPI-MODEL has a high in vivo-in vitro correlation, and very low lot-to-lot variability. LabCyte EPI-MODEL can be used to determine the skin irritation potential of a wide range of chemicals through the analysis of cell viability using the MTT assay. Moreover, since LabCyte EPI-MODEL is metabolically active, it can also be used to evaluate biological processes, such as the production of cytokines and growth factors, in response to different test substances.

A cultured model that closely reproduces human epidermal features

Model structure

Tissue structure

LabCyte EPI-MODEL
LabCyte EPI-MODEL 6D
Normal human epidermis (forearm)

EPI-MODEL has a structure similar to that of the epidermis, with a basal layer, a spinal layer, a granulous layer, and a cornified layer.
EPI-MODEL 6D is a cultured epidermal model with an under-developed cornified layer.

Protein expression pattern analysis

The expression pattern of proteins specifically expressed at different layers of the epidermis
Customer support

Japan Tissue Engineering Co. Ltd is responsible for the development, manufacture and sales of LabCyte products, and is able to offer broad support to all customers through our highly trained technical specialists.

Skin Irritation Test and other applications

LabCyte EPI-MODEL is an alternative to animal experimentation in skin irritation and toxicity tests. It can be used in pharmaceutical, dermatological and basic research. The EPI-MODEL 6D, a 3D epidermal model with under-developed cornified layers, can be used in the risk assessment of mild irritants, and the analysis of ceramide production in vitro.

Production of highly reproducible models using gold standard techniques

LabCyte EPI-MODEL is produced by highly trained and specialized staff. We guarantee the delivery of high quality products by implementing strict in house quality control tests.

*EPI-MODEL data (taken in house)

Live cell count (within-lot, lot-to-lot variation)

Barrier function analysis (SLS 18 h exposure)

- Data demonstrating the low within-lot and lot-to-lot variation in cell viability.

- Data demonstrating the high reproducibility of results between different lots.
**Tissue structure**

EPI-MODEL has a structure similar to that of the epidermis, comprising of a basal layer, a spinal layer, a granulous layer, and a cornified layer.

Morphological and structural changes of the different epidermal layers during culture.
Immunohistochemistry

Detection of proteins expressed in the cornified and viable layers of the epidermis.

Ultrastructure

Ultrastructure of epidermal layers observed by transmission electron microscopy

Ceramide analysis

EPI-MODEL produces high levels of ceramide

Protein expression analysis by immunohistochemistry

Protocol

Paraffin embedding

1. Transfer the culture insert containing the EPI-MODEL to a tube with 4% Paraformaldehyde (PFA).
2. Leave it overnight at 4°C to fix the epidermal tissue.
3. Cut the PET membrane off from the culture insert using a scalpel.
4. Transfer enough 4% agar solution to fill half of a well of a 6-well plate.
5. Transfer the epidermal tissue to the well before the agar completely solidifies.
6. Top the well with 4% agar solution and wait until it completely solidifies.
7. Trim the excess of agar with a scalpel.
8. Transfer the tissue embedded in agar to a biopsy bag.

9. Close the biopsy bag surrounding the tissue using a stapler.

10. Sandwich the biopsy bag in between a folded Tissue-Tek foam biopsy sheet.

11. Put the tissue in paraffin embedding cassettes.
12. Rinse the tissue in tap water.
13. Remove the excess of water from the cassette and proceed with the paraffin embedding protocol.

Paraffin embedding program

Perform this step according to the instructions of the equipment being used in your laboratory.

</tbody>
</table>

Preparation of tissue sections

1. Prepare paraffin blocks according to the instructions of the equipment being used in your laboratory.
2. Store the paraffin blocks at 4°C.
3. Cut 3 mm-thick tissue sections.
4. Mount sections on glass slides.
5. Dry the slides at 40 - 60°C overnight.
Immunohistochemistry

Deparaffinization

1. Incubate slides in xylene three times for 2 min each.
2. Incubate slides in 100% ethanol three times for 1 min each.
3. Wash slides in pure water for 1 min.
4. Leave slides in pure water.

Antigen retrieval (choose according to the antibody being used)

1. Heat-induced antigen retrieval
   
   1. Put slides in a container with the buffer of your choice:
      • For pH 6: Target Retrieval Solution, Citrate pH 6 (Dako)
      • For pH 9: Target Retrieval Solution, Tris-EDTA pH 9 (Dako)
   
   2. Bring slides to 95°C and incubate them according to the antibody being used.
   3. After incubation, leave the slides in the buffer to cool down at room temperature.
   4. Transfer the slides to PBS.
   5. Circle the tissue sections with a PAP pen.

2. Proteinase K-induced antigen retrieval
   
   1. Put slides in a container with PBS.
   2. Circle the tissue sections with a PAP pen.
   3. Transfer the slides to a humidified chamber.
   4. Add Proteinase-K solution (Dako) to the tissue sections.
   5. Incubate at room temperature.
   6. Wash slides in DPBS-T three times for 2 min each.

Endogenous peroxidase blocking

1. Incubate slides in 0.3% hydrogen peroxide for 30 min at room temperature.
2. Wash slides in DPBS-T three times for 2 min each.
Blocking

1. Transfer the slides to a humidified chamber.
2. Add 100 µl of Blocking One (Nacalai Tesque) to each slide.
3. Block slides for at least 30 min at room temperature.

Primary antibody

1. Dilute the primary antibody with Dako REAL antibody diluent (Dako).
2. Remove the blocking solution and add 100 µl of the diluted antibody solution to each slide.
3. Incubate for 1 h at room temperature.

Secondary antibody

Secondary antibody solution:
- Anti-rabbit secondary antibody (HRP-conjugated) ImmPRESS Reagent, Anti-Rabbit Ig (VECTOR)
- Anti-mouse secondary antibody (HRP-conjugated) ImmPRESS Reagent, Anti-Mouse Ig (VECTOR)
1. Wash slides in DPBS-T three times for 2 min each.
2. Add 100 µl of the appropriate secondary antibody solution.
3. Incubate for 30 min at room temperature.
4. Wash slides in DPBS-T three times for 2 min each.
5. Wash slides in DPBS for 2 min.

Signal staining using Histogreen (AbCys)

6. Add 2 drops of Histogreen-Chromogen (No. 1) to 1 ml of Histogreen-Buffer (No. 2) and mix well.
7. Prepare HistoGreen by adding two drops of H$_2$O$_2$ (No. 3) to the solution prepared above. Mix well.
8. Add 100 µl of HistoGreen to each slide.
9. Incubate for 1 - 5 min at room temperature.
10. Wash slides in DPBS three times for 2 min each.
11. Shortly wash in pure water.

Dehydration and mounting

1. Incubate slides in 100% ethanol three times for 30 sec each.
2. Incubate slides in ethanol : xylene (1:1) mixture for 30 sec.
3. Incubate slides in xylene three times for 30 sec each.
4. Mount sections with coverslips using VectaMount™ Permanent Mounting Medium (Vector)
Transglutaminase

Expression detected from spinous to cornified layer.

Laminin-332

Expression detected in the basal and spinous layers, as culture progressed.

Collagen IV

Expression detected in the basal layer.

Collagen VII

Expression detected in the basal layer.

Ki-67

Ki67 is a widely used proliferation marker.
Expression detected in the cells of the basal layer, as it is observed in human skin.

### p63

Day 0  
Day 3  
Day 7

p63 is often referred to as a marker for epidermal stem cells. Expression detected in the basal and spinous layers, as it is described in human skin.

### PCNA

Day 0  
Day 3  
Day 7

PCNA is a widely used proliferation marker. Expression detected in the cells of the basal layer, as it is described in human skin.

### Claudin-1

Day 0  
Day 3  
Day 7

Claudin-1 is a tight junction marker. Expression detected from basal to granular layer, similar to human skin.

### Claudin-4

Day 0  
Day 3  
Day 7

Claudin-4 is a tight junction marker. Expression detected from basal to granular layer, similar to human skin.

### E-cadherin

Day 0  
Day 3  
Day 7

E-cadherin is an adherens junction marker. Expression detected from basal to granular layer, similar to human skin.
Desmoglein 1

Desmoglein is a desmosome marker. Expression detected between the basal and granular layer, similar to human skin.

Filaggrin

Expression detected from the granular to cornified layer, similar to human skin.

Loricrin

Expression detected in the granular layer, similar to human skin.

Involucrin

Involucrin is an epidermal differentiation marker. Unlike in human skin, expression was detected in all layers of the epidermal tissue.

Keratin 1

Keratin 1 is an epidermal differentiation marker. Expression detected from spinous to cornified layer, similar to human skin.

Protein expression analysis by Western blotting

Protein extraction

1. Rinse the epidermal tissue with PBS and cut the membrane off from the culture insert with a scalpel.
2. Transfer the tissue to a 1.5 ml microtube.
3. Leave the microtube on ice. If necessary, store the tube at -80°C, and thaw the tissue on ice prior use.
4. Transfer the tissue to a 10 cm dish, and cut it in small pieces with a scalpel.
5. Transfer the tissue fragments to a new 1.5 ml microtube.
6. Add 200 - 300 µl of RIPA buffer to each microtube.
7. Homogenize the tissue using a BioMasher™II (Nippi).
8. Sonicate for 30 min (37 W).
9. Centrifuge the microtube for 10 min (15,000 x g, 4°C).
10. Transfer the supernatant to a new 1.5 ml microtube.
11. Centrifuge the microtube for 10 min (15,000 x g, 4°C).
12. Transfer the supernatant to a new 1.5 ml microtube.
13. Estimate the protein concentration by BCA or Bradford assay.

Immunoblotting

1. Mix 10 µg of protein sample to 2x Laemmli buffer (SIGMA-ALDRICH) and mix well.
2. Heat the sample to 100°C for 2 min.
3. Briefly centrifuge the tube.
4. Load onto a SDS-PAGE gel (1 mm gel, Tris-Glycine, 15 mA).
5. Rinse the gel in Tris-Glycine buffer for 10 min.
6. Prepare a PVDF membrane (Amersham Hybond P PVDF 0.45) by incubating it in methanol for 1 min, and washing it in distilled water for 5 min.
7. After transfer, block the membrane in 5% skim milk in TBS-T (1 h at room temperature).
8. Dilute the primary antibody in 5% skim milk in TBS-T.
9. Transfer the membrane to the primary antibody solution and incubate overnight at 4°C.
10. Wash the membrane in 5% skim milk in TBS-T three times for 15 min each.
11. Wash the membrane in TBS-T for 5 min.
12. Dilute the secondary antibody in TBS-T.
13. Transfer the membrane to the secondary antibody solution and incubate for 2 h at room temperature.
14. Wash the membrane in TBS-T three times for 15 min each.
15. Treat the membrane with ECL Western Blotting Detection Reagents (GE Healthcare).
16. Reveal the signal using a LAS4000 or equivalent.

Gene expression analysis by qPCR

RNA extraction

1. Rinse the epidermal tissue with PBS.
2. Cut the membrane off from the culture insert with a scalpel, and transfer the tissue to a 1.5 ml microtube.
3. Leave the microtube on ice. If necessary, store the tube at -80°C, and thaw the tissue on ice prior use.
4. Transfer the tissue to a 10 cm dish, and cut it in small pieces with a scalpel.
5. Transfer the tissue fragments to a new 1.5 ml microtube.
7. Add 200 µl of lysis buffer to each tube.
8. Homogenize the tissue using a BioMasher® II (Nippi).
9. Using a seringe, pass the tissue fragments through a 21G needle at least 10 times.
10. Centrifuge the microtube at 2 min (12,000 x g, room temperature).
11. Transfer the supernatant to a fresh microtube, add the same volume of 70% ethanol and mix well by vortexing.
12. Transfer 700 µl of the solution above to a spin column.
13. Centrifuge the microtube for 15 sec (12,000 x g, room temperature) and discard the flow through.
14. Repeat steps 12 and 13 if necessary.
15. Add 350 µl of Wash buffer I.
16. Discard the flow through and transfer the column to a fresh microtube.
17. Add 80 µl of PureLink DNA mixture.
18. Incubate for 15 min at room temperature.
19. Add 350 µl of Wash buffer I.
20. Centrifuge the microtube for 15 sec (12,000 x g, room temperature) and discard the flow through.
21. Add 500 µl of Wash buffer II.
22. Centrifuge the microtube for 15 sec (12,000 x g, room temperature) and discard the flow through.
23. Add 500 µl of Wash buffer II.
24. Centrifuge the microtube for 15 sec (12,000 x g, room temperature) and discard the flow through.
25. Centrifuge the microtube for 1 min (12,000 x g, room temperature) and discard the flow through.
26. Transfer the column to a fresh microtube.
27. Add 50 µl of Rnase-free water to the center of the filter of the spin column.
28. Incubate for 1 min at room temperature.
29. Centrifuge the microtube for 2 min (12,000 x g, room temperature).
   The flow through contains the extracted RNA.
30. Use the Quant-iT™ RNA Assay Kit (Thermo Fisher) to estimate the RNA amount.
Reverse transcription and qPCR

1. Transfer 100 ng of RNA to a PCR tube.
2. Perform a reverse transcription reaction using the SuperScript® VILO™ cDNA Synthesis Kit (Thermo Fisher).

Skin Irritation and corrosion Test

LabCyte EPI-MODEL 24 was accepted by the OECD to be used in the irritancy and corrosivity assessment of chemical substances under the test guideline 439 and 431.

The OECD Guidelines are internationally agreed testing methods used by government, industry and independent laboratories to identify and characterize potential hazards of chemicals. OECD Test Guideline 439 and 431 describe in vitro procedures that may be used for the hazard identification of chemicals (substances and mixtures) using reconstructed human epidermis that closely mimics the biochemical and physiological properties of the outermost layer of the human skin.

Results interpretation

Cell Viability ≤ 50% irritant (I)
Cell Viability > 50% non-irritant (NI)

Percutaneous absorption test

Percutaneous absorption test can be performed by simply attaching the culture insert to a glass vial.

Permeability test

Skin permeability test using LabCyte EPI-MODEL

Skin permeability tests can be performed by sandwiching the LabCyte EPI-MODEL between silicone elastomer adapters, and then mounting the adapters between side-by-side diffusion cells.

Data courtesy of Dr. T. Hikima (Kyushu Inst. Tech.)

Data courtesy of Dr. S. Fukushima (Kobe Gakui Univ.)
Dimensions compatible with EPI-MODEL 12
Prepare your own epidermal model by simply seeding and culturing keratinocytes in cell culture inserts

Proliferation and differentiation rates vary according to culture conditions. The data above should be used as reference only. Assessing sample histology during culture is highly recommended.

Application example

- Apply test substances and perform model analysis at a time of your convenience.
Gene expression knockdown in epidermal models prepared with LabCyte EPI-KIT

Introduction

The experiment presented here (filagrin knockdown) was designed based on information available in the literature. Please use the protocol below as a reference for gene expression knockdown in cultured epidermal models.

Reference

Journal of Investigative Dermatology vol 130 2286-2294 (2010)

Knockdown of filagrin impairs diffusion barrier function and increases UV sensitivity in a human skin model.
Midler M et., al.

Material

- siRNA-1 (filagrin targeting sequence siRNA-1)
  sense: 5-GAGGUUGCUGGUCGCUUCCAGA-3
  antisense: 5-UGGAAGCAGACCCAGACCACCUCUC-3

- siRNA-2 (filagrin targeting sequence siRNA-2)
  sense: 5-ACAGAAGCACAGUCAUGAUAA-3
  antisense: 5-AUCAUGACUGUGCUUUCUGUGC-3

- siRNA-3 (filagrin targeting sequence siRNA-3)
  sense: 5-GAGGUUGCUGGUCGCUUCCAGA-3
  antisense: 5-UGGAAGCAGACCCAGAACCACCUC-3

- ctrl-siRNA (siRNA control sequence)
  sense: 5-GAGGUUGCUGGUCUCCGUUAGA-3
  antisense: 5-UACGGAAGACCCAGACCCACUC-3

- Opti-MEM®
  Life Technologies, Code 31985-070, 500ml

- Lipofectamine®2000 Transfection Reagent
  Life Technologies, Code 11668-027, 0.75ml

Protocol

The measurements below are for the preparation of one 24-well plate using one siRNA sequence. Measurements should be adjusted for fewer wells.

1. Preparation of siRNA-Lipofectamine® complex

Prepare the complex in 15 ml tubes, under sterile conditions, using the measurements below.

- siRNA mixture
- 5 ml OPTI-MEM®
- 50 μl Lipofectamine® 2000
- 26 μl 100 μM siRNA

Prepare your Mock transfection sample without siRNA at this point, if necessary.
Leave the siRNA-Lipofectamine® complex resting at room temperature for 30 min.
2. Transfection

1. Thaw keratinocytes according to the EPI-KIT instruction manual.
2. Add 7 ml of assay medium to siRNA - Lipofectamine® complexes and mix well.
3. Add thawed keratinocytes to siRNA-containing mixture prepared in step 2.
4. Gently mix the solution prepared in step 3, and add 500 μl to each cell culture insert.

■ Results

1. Epidermal model histology

Media was removed from the cell culture inserts, and keratinocyte culture was done according to the EPI-KIT instruction manual.

Cultured models were fixed in 4% Formalin Neutral Buffer Solution, at 7d, 9d, and 11d. Untreated: Models prepared according to EPI-KIT standard protocols. Mock: Models prepared with the addition of Lipofectamine®, without siRNA, before cell seeding. siRNA-1, siRNA-2, siRNA-3, ctrl-RNA: Models prepared with correspondent siRNA-Lipofectamine® complex. Dotted circles showing cells containing keratohyalin granules. Cells containing keratohyalin granules not found in models transfected with siRNA-1 and siRNA-3.
2. Immunohistochemistry

Immunohistochemistry was performed on epidermal models fixed at 11 d. Filaggrin staining (red) showed by white arrows. Primary antibody: Anti-filaggrin antibody (Neuromics MO20041). Secondary antibody: Alexa FluorR 546 Goat Anti-Mouse IgG (H+L) (Life Technologies A-11030). Nuclear staining (blue): Hoechst 33258. Filaggrin was not detected in models transfected with siRNA-1 and siRNA-3.

3. Epidermal barrier function assessment

Barrier function test was performed using models cultured for 13 d. 25 µl of SLS-PBS solution (SLS concentration: 0%, 0.1%, 0.15%, 0.2%, 0.3%) was added to the models (n = 3) that were then incubated in a CO₂ incubator for 18 h at 37°C. After 18 h, models were rinsed with DPBS (add 0.5 ml of DPBS to the culture insert and discard - repeat 3 times). Rinsed models were processed for MTT assay. Data were normalized by results from 0% SLS treatment (0% SLS cell viability = 100%). Average of 3 readings (n = 3) plotted in the graph above. Model transfected with siRNA-2 showed higher barrier function compared to untreated model.

Note: The results of this experiment differ from those of the reference article (siRNA-1, siRNA-2, siRNA-3 show the same results).
LabCyte CORNEA-MODEL is a 3-D human cultured corneal epithelial tissue produced from normal human corneal epithelial cells. LabCyte CORNEA-MODEL was developed by applying cell culture techniques to differentiate and stratify corneal epithelial cells to form a tissue structure similar to that of the normal human cornea. LabCyte CORNEA-MODEL can be used in the hazard identification of irritant chemicals by the eye irritation test. Moreover, CORNEA-MODEL can also be used to evaluate biological processes, such as the production of mucin and the expression of adhesion molecules, in response to different test substances.

Model features

3-D culture of human corneal epithelial cells
Can be used for eye irritation tests. Enables the analysis of proteins specifically expressed in the corneal epithelium.

Low lot-to-lot variability
Developed and manufactured at J-TEC using cell culture techniques fostered in house.

Model structure

Reproducing the corneal epithelial structure

HE staining
Cell differentiation and stratification.

Transmission electron microscopy
Observation of microvilli and glycocalyx (arrows) on the outermost layer of cells.

Immunohistochemistry
Detection of proteins expressed at different cells layers of the corneal epithelial.

Mucin-1  Mucin-16  Desmoglein-3  Laminin V
OECD Test Guideline 492 - Eye Irritation Test

LabCyte CORNEA-MODEL was accepted by the OECD to be used in the eye irritancy assessment of chemical substances under the test guideline 492. The OECD test guidelines are internationally accepted testing methods used by government, industry and independent laboratories to identify and characterize potential hazards of chemicals. OCED test guideline 492 describes an in vitro procedure that may be used for the hazard identification of eye irritant chemicals using reconstructed human cornea-like epithelium that closely mimics the biochemical and physiological properties of the outermost layer of the human corneum epithelium.

Test procedure

1. Pre-incubation
2. Application of test substance, rinsing, and post-exposure incubation (conditions differ according to the physical state of the tested chemical)
3. Cell viability measurement (WST-8 assay)
4. Determine whether results meet acceptance criteria
   1. Cell viability: 0.5 \(\leq\) mean OD (A450/650) measured value for negative control \(\leq\) 1.6
   2. Positive control: mean tissue viability for positive control \(\leq\) 40%
   3. SD: SD (negative control and positive control) of tissue viability of three indentical replicates \(\leq\) 18
